

# AttestLayer Sample Verification Kit

*Representative PASS package for format and verification review*

This sample kit shows what an AttestLayer representative PASS package looks like. It is designed to demonstrate package structure, verification flow, and buyer-facing deliverables. It is not an audit report, compliance certification, or legal conclusion.

## What is included

- A representative review-ready binder
- A signed receipt bound to the manifest
- A public key snapshot for offline verification
- A package map describing each file
- A self-contained offline verifier

## What this proves

- The package structure is deterministic
- The receipt can be verified against the bundled public key
- The sample shows how AttestLayer packages a representative PASS output
- Verification can be performed locally in browser or offline

## What this does not prove

- It does not certify controls
- It does not assess risk
- It does not guarantee factual accuracy of submitted evidence
- It does not replace an audit, certification, or legal opinion

## How to verify

- Online: upload the untouched ZIP at [verify.attestlayer.com](https://verify.attestlayer.com). Verification runs locally in-browser.
- Offline: extract the ZIP and open `verifier/index.html` locally.

---

Open README-FIRST.md for a file-by-file explanation. Open `artifacts/sample-binder.pdf` for the representative binder.
